Subject: Technical and financial offer

GFT1004: DELAY GENERATOR

Services and Prices

This offer is for the supply a Digital Delay Generator model GFT1004. The price for the deliverables is given in the table below. Shipment and VAT are not included in the price.

Item	Model	Description	Unitary	Quantity	Total
			Price (€)		Price (€)
1	GFT1004-	4 Channel Digital Delay Generator with	9 440,00	1	9 440,00
	1-2-3-7	following option:			
		• 1: Extension to 8 channels			
		• 2: optical input for timing system –			
		ELI Application			
		• 3: clock output			
		• 7: TTL level channel output			
		Supply:			
		- GFT1004			
		- User' manual			
		- Certificate of calibration			

<u>Shipment</u>

Price	Delivery
80,00 Euros	ELIBEAMS
	Za Radnicí 835 - Dolní Břežany, 252 41
	Czech Republic

Delivery schedule

Description	Delivery
Item 1	8 weeks

Payment terms

Payment of total price	Delivery
100 %	At the delivery, 30 days end of the month

Time of validity

This quotation is valid two months.

<u>Warranty</u> The product and services delivered by Greenfield Technology, parts, and labour, are guaranteed for one year. The warranty begins on the date the goods are delivered.

1. GFT1004 delay generator for ELI-Beams application

Presentation

Greenfield Technology has developed high precision timing systems for 20 years.

The one presented here has been customized to fulfill Eli Beams Application (LLNL/HALPS requirements). One of the major system specifications is the Master Timing Generator (MTG) phase locked specification to the 80MHz external clock with an rms jitter from clock to optical data stream less than 10ps.

The primary function of the Delay Generators is the generation of precision trigger pulses based on user settable delays and data control keys received from the MTG via an optically transmitted serial data stream. Data control keys include epochs and single shot events that control timing of the laser system.

Functional overview

Block diagram: The GFT1004 includes the five following functions: Time base, Trigger controller, Delay Channels, Channel Output and Interface controller.

<u>Time Base</u>: This function provides a 160 MHz time base from an internal reference or recovered from the optical input.

Trigger Controller:

This function provides several trigger sources to each delay channel

- One external trigger source: When the external trigger source is selected, a rising edge on "TRIG IN" starts a delay sequence. After each channel's delay period, a pulse appears on each channel's output
- Two internal trigger sources from two synchronous timers. The frequency of each timer is programmable from 1 Hz to 100 kHz
- Data control keys recovered from the optical input. Optical trigger sources are operated in conjunction with a GFT3001 Master Timing Generator that controls a number of GFT1004. The GFT3001 provides an optical serial data stream for time base synchronization to the multiple GFT1004 units. This serial data stream is composed of single-shot, repetitive trigger, and inhibition key trigger sources. GFT1004 devices can be located at distance greater than 1 km from the GFT3001 Master Timing Generator.

Delay Channel: They are 4/8/10 independent delay channels. The delay from the selected trigger source is programmable up to 10 seconds in 1 ps increments.

T0 output channel is used as a time reference (delay = 0) for all delayed output pulses.

<u>Channel Output:</u> Each delayed output pulse can be independently adjusted in level (2.5 to 6 V) and width. The outputs are designed to drive a 50 Ω load.

Interface Controller: It manages internal functions and user interfaces. The parameters can be locally controlled over the front panel keys, and remotely displayed and controlled via Ethernet (10/100 Mb/s) or Internet (web page from internal web server)

All parameter values (delay, level, width) are automatically saved.

Specifications

- Time base: 160 MHz
- Inhibition input: without
- Clk input: without
- Optical Timing system mode for Eli Beams Applications: 80MHz synchronized data stream composed of 6 Epochs, 4 single shot keys and one inhibition key

Other specifications are the same as the ones given in the GFT1004 data sheet with option 1, 2, 3, and 7.

Mechanical interface

Same as a standard GFT1004.

Greenfield add on a rear panel a sticker. Sticker indicates:

Optical Timing system mode for Eli Beams Application Without inhibition input and clock input

Control and Software tools

Greenfield Technology will program a specific embedded software:

- FPGA: 1.0
- Interface controller: 3.0.9

Management, documentation

Greenfield Technology has not includes a meeting with Eli Beams for this Technical and Financial offer.

Documentations provided:

- GFT1004 user manual for Eli Application, ref NUT065
- Test report

2. GFT1004 - 4 channel digital delay generator / Data sheet

Features

- Four Independent Delay Channels (up to ten in option) 1 ps Time Resolution
 - <10 ps Jitter for Internal Triggered Delays
 - <25 ps Jitter for External Triggered Delays
- Adjustable Output Pulse up to 10 V, 1 ns Rise Time
- External or Internal Trigger Sources for Every Channel
- External or Internal Ingger Sources for Every Channel Internal or External Clocking up to 90 MHz Independent Control of Delay, Width, and Amplitude Controlled via Ethernet, Web Page and Front Panel
- Compact Packaging 1U, 19'
 - Options: Extension to 8 or 10 Channels Output pulse: TTL, 20 V, 32 V, or Optical

Applications

- Components Test
- Automated Test Equipment (ATE)
- System Laser Timing Control
- Control Flash Lamps and Q-
- switches
- Synchronization with selectable clock frequency - Mode Locked Laser
- Precision Pulse Application
- Gate High-Speed Cameras
- Instrument Triggering

Description

The GTF1004 Digital Delay Generator provides four independently delayed pulses on the rear panel with options for eight or ten channels. Delays up to 10 seconds can be programmed with 1 ps resolution, and channel-to-channel jitter is less than 10 ps RMS. BNC outputs deliver up to 10 V, 1 ns under 50 Ω. Pulse amplitude and width are adjustable on each output channel.

One input channel, or two internal synchronized timers are used to trigger all output channels. One T0 channel is used as a time reference for all of the delayed output pulses.

The GFT1004 is a Digital Delay Generator that operates either as a standalone device, or as a component in a timing system (Option 2). In a timing system (see below), the GFT1004 is operated in conjunction with a GFT3001 Master Transmitter that controls and synchronizes a number of GFT1004 DDGs via optical fibers.

GFT1004 parameters can be locally controlled over the front panel keys and LCD display, and remotely controlled via Ethernet (10/100 Mb/s) or Internet (web page from internal web server).

Timing System Application with 3 Slave Generators (24 delay Channels)

GFT1004 4 Channel Digital Delay Generator

Functional Overview

<u>Block Diagram:</u> The GFT1004 includes the five following functions: Time Base, Trigger Controller, Digital Delay Channel, Channel Output and Interface Controller.

Block diagram of the delay generator

<u>Time Base</u>: This function provides a 155.52 MHz time base from an internal reference or an external 10 MHz reference. As an option, the external reference can be up to 90 MHz (Ask to factory).

Trigger Controller:

This function provides 4 trigger sources to each delay channel

- External trigger source: When the external trigger source is selected, a rising edge on "TRIG IN" starts a delay sequence. After each channel's delay period, a pulse appears on each channel's output
- There are two internal trigger sources from two synchronous Timers. The frequency of each Timer is programmable from 1 Hz to 100 kHz
- Optical trigger source (as an option) is operated in conjunction with a GFT3001 Master Transmitter that controls a number of GFT1004. Via optical fiber, the GFT3001 provides a serial data stream for time base synchronization, single-shot, repetitive triggers, and inhibition information to the multiple GFT1004 units at distance greater than 1 km from the GFT3001 Master Transmitter.
 "Inhibition input" allows the system to quickly inhibit selected outputs.

Delay Channel: They are 4 independent delay channels (with options for eight or ten channels). The delay from the selected trigger source is programmable up to 10 seconds in 1 ps increments.

"T0" output channel is used as a time reference (delay = 0) for all delayed output pulses. Channel Output: Each delayed output pulse (T1 to T10) can be independently adjusted in level and

width. The outputs are designed to drive a 50 Ω load.

As an option, channel output level can be 2.5 to 6 V, or 5 to 20 V, or fixed 32 V, or optical pulse.

Interface Controller: It manages internal functions and user interfaces. The parameters can be locally controlled over the front panel keys, and remotely controlled via Ethernet (10/100 Mb/s) or Internet (web page from internal web server) All parameter values are automatically saved. **Example of channel output mode**

Control and Software Tools

They are three ways to control the generator: - <u>"local way"</u> via the front Panel Display an Key board

Display example: Settings of Channel T1

"<u>Ouick remote way"</u> via Internet and control panel web pages. Web page, from embedded Web server, provides a simple method to configure settings for each channel (delay, output amplitude, polarity, output width, trigger mode, trigger source), to control operation and to display the status of the instrument.

The configuration information of the instrument is stored and saved in the GFT1004.

The web page can be opened via Internet Explorer, Mozilla Firefox or Chrome.

After connecting a cable from the GFT1004's Ethernet port to your computer network, enter the GFT1004's IP address into your PC's browser (the IP address can be identified or assigned via the front panel). The browser will automatically open the control panel web page on your PC.
