

1. **Introduction**

The purpose of this study is to investigate the effects of the proposed system on the performance of the participants. The study was conducted in a controlled environment and involved a group of participants who were randomly assigned to two conditions: the control group and the experimental group.

The study was designed to measure the following variables:

1. **Performance Time**

The performance time was measured as the time taken by the participants to complete the task. The results showed that the experimental group performed significantly faster than the control group. This suggests that the proposed system has a positive effect on the performance of the participants.

The study was conducted in a controlled environment and involved a group of participants who were randomly assigned to two conditions: the control group and the experimental group.

The study was designed to measure the following variables:

Variable	Control Group	Experimental Group
Performance Time	12.5	10.2
Accuracy	95%	98%
Subjective Rating	4.5	5.2

The results of the study indicate that the proposed system has a positive effect on the performance of the participants. The experimental group performed significantly faster and more accurately than the control group. This suggests that the proposed system is effective in improving the performance of the participants.
